

Neat Video quick start guide

1. Installing the plug-in

To install the Neat Video v4 plug-in for Vegas

1. Make sure you have started Vegas at least once before installing the plug-in. If you have not done it yet, start Vegas and exit it;
2. Close Vegas;
3. Download the EXE installer of Neat Video:
 - if you already purchased the product and have a current license for the Home or Pro plug-in, please use the download instruction supplied with the license to download the corresponding plug-in from the download area specified in that instruction;
 - if you want to try Neat Video before purchase please download the installer of the Demo version from this page: <https://www.neatvideo.com/download>
4. Double-click the downloaded EXE file to start the installer;
5. When you install Neat Video using its standard installer, the installer should automatically make the plug-in available to Vegas;
6. Start Vegas and find **Reduce Noise v4** in the **Video FX** list (in the main **FX** section listing all available video effects).

In case the plug-in has **not** become available in the **Video FX** list, please contact Neat Video support for assistance.

2. Running Neat Video on a sample video clip

There is a test-kit prepared to help you start using Neat Video. You can download the test-kit via this direct link: <https://www.neatvideo.com/project/resources/testkit.zip>.

Having downloaded, please unzip it to a new folder on the hard disk.

The test-kit includes a sample video clip: *SampleClip.mpg*. This is a typical video clip captured by a digital video camera in high-gain mode. Some technical information about the sample clip is available in the *SampleClipInfo.txt* file.

Please start Vegas and go through the steps below to clean the clip using Neat Video.

2.1. Add the sample clip to the project

1. Configure a new project in Vegas

- Create a new project in Vegas using 1920x1080 progressive 25fps format.
Use the **File | New... | New Project** window to configure the project and then click **OK**.

2. Add the sample clip file to the project

- Use the **File | Import | Media...** menu in Vegas to import the *SampleClip.mpg* file into the project.

3. Add the sample clip to the timeline

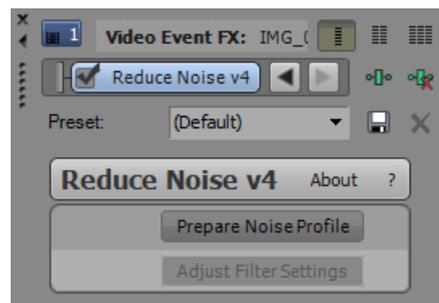

- Select the sample clip in the **Project media** window and drag-n-drop the clip into **Timeline** window. If Vegas asks “**Do you want to set your project video settings to match this media?**” select “**Yes**”.

You will then see that there is strong noise in the sample clip (see the **Video Preview** window). The task of Neat Video is to reduce this noise.

2.2. Add Neat Video effect to video clip

- 1. Click the **Event FX...** icon  in the clip shown in the **Timeline** window to open the list of available video effects;
- 2. Select **Reduce Noise v4** in the **FX** list of all video effects and click the **OK** button.

Vegas will add the **Reduce Noise v4** effect to the **Video Event FX** panel, which will list the available controls of the effect (see the picture on the right).

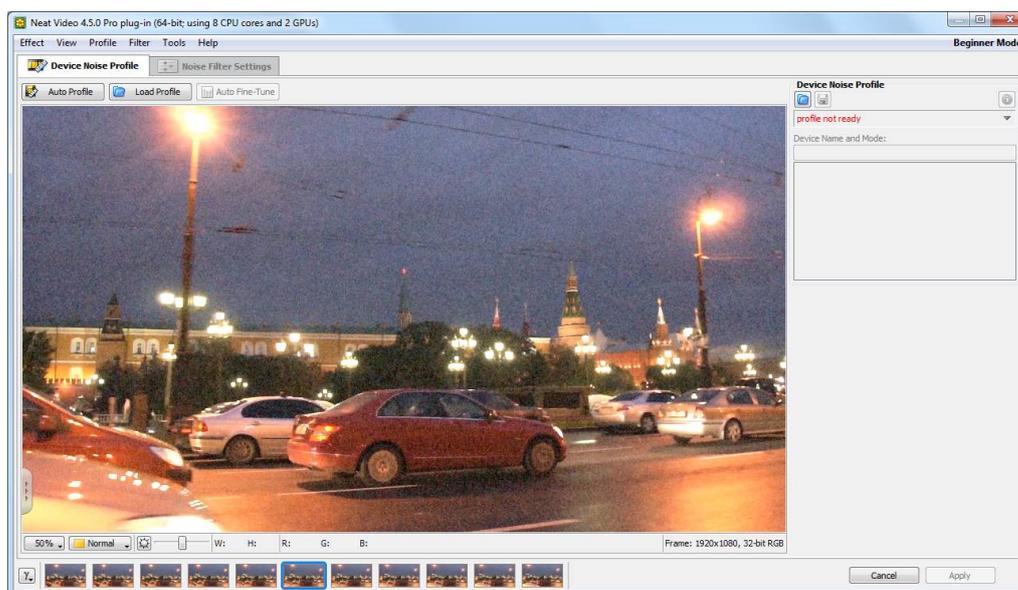

2.3. Configure Neat Video

1. Open Neat Video plug-in window

- Use the **Timeline** controls to select a frame with large flat featureless areas; the selected frame will be used for noise analysis in the next stages.
- In the **Video Event FX** panel, click the **Prepare Noise Profile...** button (under **Reduce Noise v4**) to open the main window of the plug-in.

(If you run the Demo plug-in, click **OK** in the popup splash screen of the plug-in to proceed further.)

The **Neat Video plug-in** window will open and display the current frame from the clip.

- At this point Neat Video may ask to specify the scan type of the clip. Please select **Progressive**.

2. Build a noise profile for the clip

To reduce noise in this frame and in the whole clip, Neat Video generally needs a noise profile describing the noise properties of the clip. You can prepare such a profile using the **Auto Profile** function:

- In the **Device Noise Profile** tab  **Device Noise Profile** click  **Auto Profile**

The **Auto Profile** function will find and select an area for main analysis. Neat Video will then automatically analyze the noise in that area to build a new noise profile.

Neat Video is then ready to filter the sample clip.

3. Check preview

- Switch to the **Noise Filter Settings** tab

You will notice that Neat Video has already applied noise reduction based on the default filter settings and the preview shows a clearly visible difference: there is less noise than in the original frame.

You can try to adjust the filter settings and see how that affects the results. For example, try to adjust the **Temporal Filter > Radius** setting (in the **Temporal** tab in the **Filter Settings** box in the right part of the window) from 2 to 1 or to a higher value. This will apply weaker or stronger temporal noise reduction to the frame.

4. Apply the changes

- Click  in the bottom of the plug-in window.

Neat Video will save the current settings and close its main window.

(If you run the Demo plug-in, it will also describe the limitations of the Demo version at this point.)

2.4. Render the video

To apply Neat Video noise reduction

- Use the **File | Render As...** menu item in Vegas.

This will automatically apply Neat Video noise reduction to the sample clip and save the result to a new video file on the hard drive. You will then be able to open this new file, evaluate the filtration results and adjust the filter settings if necessary.

You can also use the **Tools | Selectively Prerender Video...** menu item in Vegas to prerender the preview only, without saving the results to the disk. You will see that the noise in the resulting clip is significantly reduced while the true details are preserved.

You can also find that the resulting noise-free clip can be compressed better (the file size is smaller) than the original noisy clip (this depends on Vegas' compression settings).
